At last a jib strong enough to carry the weight of a fully loaded Digital Betacam. It will handle any camera and head up to 27kgs in total. It folds down to fit in to one small road case. Easily and quickly assembled by one person. An extension arm is supplied so only half the normal weight is needed to counter balance the camera.

If carrying the weights around is restrictive a semi rigid counter weight bag is supplied and can be filled with just about anything on location, rocks, sand etc.

The jib has a tilt brake so can easily be operated by one person. An under slung bracket is also included, great for extremely low ground shots or across a table.

The camera can be just a couple of centimeters off the ground or with a tripod at full height the camera can crane up to over 3 meters in height.

The bowl will take a 75mm or a standard 100 mm tripod head.

A quick, easy and portable camera platform !!
